NAFLD is the buildup of extra fat in the liver that is NOT caused by alcohol. It is normal for the liver to contain some fat. However, if more than 5% - 10% percent of the liver’s weight is fat, then it is called a Fatty Liver.

It is estimated that up to 20% of Americans have Fatty Liver. Fatty Liver can progress to Non-Alcoholic Steatohepatitis (NASH), which means that along with fat, there is inflammation and damage to your liver.
